# New synthesis of substituted 6-methylbenzo[b]furo-, -thieno-, and -seleno[2,3-c]quinolines, and heterocyclic analogues 

S. Deprets and G. Kirsch<br>Laboratoire d'Ingéniérie Moléculaire et de Biochimie Pharmacologique<br>Université de Metz, Ile du Saulcy, F-57045 METZ Cedex 1<br>E-mail: kirsch@bridoux.sciences.univ-metz.fr

#### Abstract

Substituted 6-methylbenzo[b]furo, -thieno-, and -seleno[2,3-c]quinolines were synthetized either by thermal electrocyclisation of the 2-ethanonoximes of 3-phenyl- and 3-hetaryl-substituted benzo[b]furans, -thiophenes, and selenophene, or by treatment of the corresponding $O-2,4$ dinitrophenyl oximes with sodium hydride.

Keywords: Coupling, triflates, benzo[b]hetarylquinolines,electrocyclisation ,oximes

## Introduction

We present here the synthesis of 6-methylbenzo[b]furo-, thieno- and seleno[2, 3-c]quinolines 1 and their analogues derived by replacing the benzene ring of the quinoline moiety either by thiophene 2 or furan 3.

$$

& \text { 1b }(R=C I, X=O) \\
& \text { 1c }(R=H, X=S) \\
& \text { 1d }(R=H, X=S e)
\end{aligned}
$$

2a ( $\mathrm{R}=\mathrm{H}, \mathrm{X}=\mathrm{Y}=\mathrm{S}$ )
2b ( $\mathrm{R}=\mathrm{H}, \mathrm{X}=\mathrm{O}, \mathrm{Y}=\mathrm{S}$ )
2c ( $\mathrm{R}=\mathrm{SCH}_{3}, \mathrm{X}=\mathrm{O}, \mathrm{Y}=\mathrm{S}$ )
3 ( $\mathrm{R}=\mathrm{H}, \mathrm{X}=\mathrm{S}, \mathrm{Y}=\mathrm{O}$ )

6-Methylbenzo[b]furo[2,3-c]quinoline 1 has previously been obtained from 2-amino-2'hydroxybenzophenone. ${ }^{1}$ However, this method can not lead to 6-methylbenzo[b]thieno- and seleno[2,3-c]quinolines $\mathbf{1}(\mathrm{X}=\mathrm{S}$ or Se ) or to the heterocyclic analogues $\mathbf{2}$ and 3 . Hence, we have
developed a novel and general method for the preparation of compounds $\mathbf{1 , 2}$ and $\mathbf{3}$ starting from readily available 2-acetyl-3-bromo or 2-acetyl-3-(trifluoromethanesulfonyloxy)benzo[b]furan, benzo[b]thiophene and -benzo[b]selenophene.

## Results and Discussion

A key step of this strategy is the preparation of 3-hetaryl-substituted 2-acetylbenzo[b]furan, -thiophene and -selenophene derivatives $\mathbf{8}$ by palladium-catalysed cross-coupling between 3-bromo-2-acetylbenzo[b]thiophene 4a, -selenophene $\mathbf{4 b}$ or diversely substituted 3-trifluoromethanesulfonyloxy)benzo[b]furans $\mathbf{5 a - c}$, -thiophene $\mathbf{5 d}$ and various organostannanes $\mathbf{6 a - c}$ or organoboronic acids $\mathbf{7 a}-\mathbf{c}$. Compounds $\mathbf{4 a - b}$ were obtained from 3-oxobenzo[b]thiophene or selenophene, and the 3-trifluoromethanesulfonyloxy derivatives 5a-d were prepared from the corresponding hydroxy derivatives as described earlier. ${ }^{2,6}$

Scheme 1. i: $\mathrm{ArB}(\mathrm{OH})_{2}, 2 \mathrm{~N} \mathrm{Na}_{2} \mathrm{CO}_{3}, \mathrm{Pd}_{( }\left(\mathrm{PPh}_{3}\right)_{4}$, DME (for $\mathrm{E}=\mathrm{Br}$ ); ii: $\mathrm{ArB}(\mathrm{OH})_{2}, \mathrm{CuI}, 2 \mathrm{~N}$ $\mathrm{Na}_{2} \mathrm{CO}_{3}, \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$, toluene $\left(\mathrm{E}=\mathrm{OTf}\right.$ ); iii: $\mathrm{ArSnBu}_{3}, \mathrm{CuBr}_{2}, \mathrm{Pd}_{( }\left(\mathrm{PPh}_{3}\right)_{4}$, dioxane (for $\mathrm{E}=\mathrm{Br}$ or OTf). For R, X, and Ar see Table 1.

* $\mathbf{6 a}=\mathrm{PhSnBu}_{3}, \mathbf{6 b}=$ 2-thienyl $\mathrm{SnBu}_{3}, \mathbf{6 c}=$ 2-furylSnBu $\mathbf{H}_{3} ; \mathbf{7 a}=\mathrm{PhB}(\mathrm{OH})_{2}, \mathbf{7 b}=$ 2-thienyl $\mathrm{B}(\mathrm{OH})_{2}, 7 \mathrm{c}=2$-furylB $(\mathrm{OH})_{2}$

Coupling between the substituted 2-acetyl-3-bromo or 2-acetyl-3-trifluoromethanesulfonyloxy)benzo[b]furans, -thiophenes and -selenophene 4 and 5, respectively, and boronic acids 7 using a modification of Suzuki's procedure ${ }^{3 b, c}$ (Scheme 1) afforded the biaryl derivatives $\mathbf{8 a}-\mathbf{h}$ in moderate to good yields (Table1). Similar yields of coupling products $\mathbf{8}$ were obtained by applying Stille's conditions using organostannanes 6. The Stille reaction was carried out in refluxing dioxane in the presence of $\mathrm{Pd}^{0}$ and $\mathrm{CuBr}_{2}$ as co-catalysts ${ }^{4}$ (Scheme 1, Table1).

The ketoximes $\mathbf{9 a - h}$ were prepared in almost quantitative yields by refluxing the corresponding ketones $\mathbf{8 a - h}$ in ethanol with hydroxylamine hydrochloride and sodium acetate.

Cyclisation of oximes $\mathbf{9}$ turned out to be the critical step in the synthesis of the tetracyclic compounds 1, 2 and 3. Thermal electrocyclisation of oximes 9 in diphenylether at $190^{\circ} \mathrm{C}$ afforded the 6-methylbenzo[b]furo-, -thieno- or -seleno[2,3-c]quinolines $\mathbf{1}$ and their analogues $\mathbf{2}$ and 3 in yields lower than 20\%.

Scheme 2. i: NaH 60\%, THF, 1-chloro-2,4-dinitrobenzene (dnp = 2,4- $\mathrm{O}_{2} \mathrm{NC}_{6} \mathrm{H}_{3}$ ); ii: $\mathrm{NaH} 60 \%$, dioxane. For R, X, and Ar see Table 2.

In order to improve the yields, the cyclisation was accomplished by activating oximes $\mathbf{9}$ as O-2,4-dinitrophenyl derivatives as it has been shown by Narasaka and al. ${ }^{5}$ The activated compounds $10 \mathrm{a}-\mathrm{h}$, prepared by reacting the sodium salt of the oximes 9 with 1-chloro-2,4dinitrobenzene, were cyclised using sodium hydride in dioxane (Table 2, Scheme 2). When compound $\mathbf{1 0 b}(\mathrm{R}=\mathrm{Cl})$ was subjected to these conditions, cyclization occurred already at room temperature. Longer reaction times were required to cyclise compounds $\mathbf{1 0}$ which are substituted by a furan or a thiophene ring in position 3 (Table 2).

## Experimental Section

General Procedures. Melting points were determined on a Stuart Scientific melting point appratus MP3. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on an AC Bruker 250 MHz instrument. Infrared spectra (IR) were measured on a Perkin-Elmer 881 spectrometer. Compounds 4a-b were prepared as described. ${ }^{6} \mathrm{CH}_{3} \mathrm{CN}$ was distilled over potassium carbonate; DME was distilled over lithium aluminium hydride. Silica gel (chromagel 70-200 $\mu \mathrm{m}$ ) was used for column chromatography.

## General procedures for the Suzuki cross-coupling reactions

Procedure 1. Bromo derivatives 4a-b ( 1 mmol ) were dissolved in DME ( 50 mL ) and the resultant solution was purged with nitrogen. $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\left(1.1 \mathrm{mg}, 10^{-3} \mathrm{mmol}, 3 \mathrm{~mol} \%\right)$ was added; the mixture was stirred for 15 minutes, treated with 2 N aqueous sodium carbonate ( 2 mL ) and the solution became cloudy. The boronic acids ${ }^{8} \mathbf{7 a}-\mathbf{c}(1.1 \mathrm{mmol}$.) were added as a solid. The solution was heated under reflux until $\mathbf{4 a - b}$ was consumed (monitored by TLC). The solvent was removed in vacuum, and the residue was partitioned between diethyl ether ( 20 mL ) and water $(10 \mathrm{~mL})$. The organic layer was separated and washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuum. The residue was purified by column chromatography using $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as eluent to give $\mathbf{8 e - h}$.
Procedure 2. In an argon atmosphere, a solution of triflates $\mathbf{5 a - d}$ ( 1 mmol .), boronic acid $\mathbf{7 a - c}$ ( 3 mmol .), copper(I) iodide ( $209 \mathrm{mg}, 1.1 \mathrm{mmol}$.), 2 N sodium carbonate ( $742 \mathrm{mg}, 7 \mathrm{mmol}$.) and $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\left(34 \mathrm{mg}, 3.10^{-3} \mathrm{mmol}, 4 \mathrm{~mol} \%\right.$ ) in dry toluene ( 10 mL ) was heated under reflux until $\mathbf{5 a - d}$ has disappeared (TLC). The reaction mixture was then cooled to room temperature, and water and ethyl acetate were added. The two layers were partitioned, and the organic phase was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under vacuum. The residue was purified by column chromatography using $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as eluent to give $\mathbf{8}$.

## General procedure for the Stille cross coupling reactions

A solution of stannane $\mathbf{6 a - c}(1.04 \mathrm{mmol})$, bromo or triflate derivative $\mathbf{4 a , b}$ or $\mathbf{5 a - d}$ ( $1 \mathbf{m m o l}$ ), respectively, $\mathrm{LiCl}\left(105 \mathrm{mg}, 3 \mathrm{mmol}\right.$ ) and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\left(34 \mathrm{mg}, 3.10^{-3} \mathrm{mmol}, 4 \mathrm{~mol} \%\right.$ ) in dioxane ( 4 mL ) were refluxed in an argon atmosphere until disappearance of the triflate or the bromide (TLC). The reaction mixture was then cooled to room temperature, and water ( 40 mL ) and ethyl acetate ( 25 mL ) were added. The two layers were partitioned, the organic phase was separated, washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under vacuum. The residue was purified by column chromatography using $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as eluent to give 8 .

Preparation of $\boldsymbol{O}$-(2,4-dinitrophenyl)oximes (10a-h). A solution of oxime $\mathbf{9 a - h}$ ( 1 mmol ) in dry THF ( 3 mL ) was added dropwise to a suspension of $\mathrm{NaH}(60 \%, 26 \mathrm{mg}, 1.1 \mathrm{mmol}$ ) in dry THF ( 1 mL ) while keeping the temperature below $5{ }^{\circ} \mathrm{C}$. The resulting solution was stirred at room temperature for 1 hour. Then, a solution of 1-chloro-2,4-dinitrobenzene ( $255 \mathrm{mg}, 1.15$ mmol ) in dry THF ( 2 mL ) was added dropwise. The reaction mixture was stirred at room temperature overnight and poured into ice water. After addition of dichloromethane ( 20 mL ) the two layers separated; the organic layer was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and the solvent evaporated in vacuum. The crude product was purified by column chromatography (dichloromethane/cyclohexane 1:1).
1-(5-Bromo-3-phenylbenzo[b]furan-2-yl)ethanone $\boldsymbol{O}$-(2,4-dinitrophenyl)oxime (10a).
