## Asymmetric Synthesis and Epimerization of Aryloxazinones

## Seung-Han Lee\* and Dae-Jun Ahn

Department of Chemistry, College of Natural Science, Kyung Hee University, Yongin 449-701, Korea Received September 21, 1998

An interesting and important nonproteinogenic class of amino acids is the arylglycines<sup>1</sup> which are found in a wide range of bioactive compounds such as nocardicines<sup>2</sup> and glycopeptide antibiotics<sup>3</sup> (e.g. vancomycin, teicoplanin, ristocetin,  $\beta$ -avoparcin, and actaplanin). However, the arylglycines are difficult to synthesize in optically pure form due to the ease at which the  $\alpha$ -methine proton can undergo base-catalyzed racemization.<sup>4</sup>

Numerous approaches to the asymmetric synthesis of arylglycines have appeared, including: asymmetric Strecker synthesis;<sup>5</sup> arylation or alkylation of nucleophilic glycinates;<sup>6</sup> arylation of electrophilic glycinates;<sup>7</sup> electrophilic amination of chiral enolates;<sup>8</sup> and nucleophilic amination of  $\alpha$ -substituted acids<sup>9</sup> and others.<sup>10</sup>

Some of these works use the chiral 5,6-diphenyloxazinones as a glycine equivalent. Williams reported the asymmetric synthesis of several arylglycines *via* the cuprate or Friedel-Crafts couplings to chiral 3-bromooxazinone.<sup>7d</sup> Also the photolysis of [(amino)(aryl)carbene]chromium complexes having the optically active amino alcohol were reported to give the aryloxazinones.<sup>10b</sup> However these methodologies limit the general synthesis of various arylglycines due to the availability of aryl metal compounds.

We report herein our preliminary studies on the conversion of (arene) $Mn(CO)_{3^+} PF_6^-$  complexes to aryloxazinones, which can be converted to arylglycines, *via* their reaction with the chiral glycine equivalent, 5-phenyloxazinone (**1a** or **1b**).<sup>11</sup>

Preparation of the arene-manganese complexes were accomplished in high yields on using a modification of the procedure described by Rybinskaya et al.12 Benzene-manganese complex was obtained by means of the conventional [Mn(CO)<sub>5</sub>Br-AlCl<sub>3</sub>-heat].<sup>13</sup> (Arene)Mn(CO)<sub>3</sub> procedure complexes (2) were treated with enolate of 1a or 1b to give the substituted cyclohexadienyl- $Mn(CO)_3$  complexes (3). We could not separate the cyclohexadienyl-Mn(CO)<sub>3</sub> complexes since significant decomposition of cyclohexadienyl-Mn(CO)3 complexes occurs upon attempted silica gel chromatography. So direct treatment of these reaction mixture with N-bromosuccinimide (NBS) effected oxidative demetallation to give the *anti*-aryloxazinones (4) in moderate yields and high diastereoselectivities (Scheme 1).

The results were summarized in Table 1. We have examined the various bases and solvents (NaHMDS/DME, NaH-MDS/THF, KHMDS/THF, LiHMDS/THF, and LDA/THF) for the reaction and found that they gave the similar yields (61-67%). Also addition of HMPA did not improve the yields and diastereoselectivities. The electrophile approaches from the less hindered face of the oxazinone enolate giving the *anti*-aryloxazinone.

 Table 1. Arylation of Oxazinones Using (Arene)Mn(CO)<sub>3</sub> Complexes

entry	P	Mn complexes (2)	product	yield $(\%)^a$	$\mathrm{de}(\%)^b$
1	Boc	$R_1 = R_2 = H$	4a	63	95
2	Boc	R <sub>1</sub> =H, R <sub>2</sub> =OCH <sub>3</sub>	4b	65	90
3	Boc	R <sub>1</sub> =H, R <sub>2</sub> =OPh	4c	49	75
4	Boc	R <sub>1</sub> =H, R <sub>2</sub> =O( <i>p</i> -CH <sub>3</sub> OC <sub>6</sub> H <sub>4</sub> )	4d	55	99
5	Boc	R <sub>1</sub> =H, R <sub>2</sub> =O( <i>p</i> -PhCH <sub>2</sub> OC <sub>6</sub> H <sub>4</sub> )	<b>4e</b>	44	81
6	Cbz	$R_1 = R_2 = H$	4f	60	89
7	Cbz	R <sub>1</sub> =H, R <sub>2</sub> =OCH <sub>3</sub>	4g	55	94
8	Cbz	$R_1 = R_2 = OCH_3$	4h	62	87

<sup>*a*</sup> Yield of isolated, pure *anti*-isomer. <sup>*b*</sup> Determined from isolated yields of pure *anti*- and *syn*-isomers.

In case of the (1,3-dimethoxycyclohexadienyl)Mn complex (P=Boc,  $R_1=R_2=OCH_3$ ), use of 1 equivalent of NBS gave the complicated reaction mixture. However, use of 2 equivalents of NBS gave the mixture of *anti*-aryloxazinone **5** (25%) and monobrominated aryloxazinone **6** (30%). Brominated aryloxazinone **6** might be formed by electrophilic substitution of aryloxazinone **5** which has the electron-rich aromatic ring.

We tried the alkylation of the enolates of *anti*-3-aryloxazinones with alkyl halide to prepare the 3-alkyl-3-aryloxazinones. However, the reaction gave the epimerized *syn*-3-

<sup>a</sup> Determined from isolated yields of pure *anti-* and *syn-*isomers.

aryloxazinones instead at -78 °C. Therefore, we studied the conversion of *anti*-3-aryloxazinones to *syn*-3-aryloxazinones at low temperature. *Anti*-aryloxazinones  $4^{14}$  were treated with KHMDS in THF at -78 °C and quenched with saturated ammonium chloride solution at -78 °C to give the epimerized *syn*-aryloxazinones  $7^{15}$  in moderate yields (Scheme 2, Table 2). The treatment of *syn*-3-aryloxazinones with base at -78 °C gave the similar *syn/anti* ratios. The results show that the enolate anion of 3-aryloxazinone is stabilized by the aryl group and attacked by proton from the opposite side of the 5-phenyl group to afford the *syn*-3-aryloxazinone as a major isomer.

The equilibration experiments were done using several bases to show whether the *syn*-3-aryloxazinones were the kinetic or thermodynamic products (Scheme 3). The results show that *anti*-3-aryloxazinones are thermodynamic products (Table 3). Thus, the epimerization of the arylglycine enolate synthons demonstrated to be the result of kinetic control by equilibration experiments for phenyl adduct **4a**.

<b>Table 3.</b> Thermodynamic Equilibration Studie
--

entry	base	ratio ( <b>4a</b> : <b>7a</b> ) <sup>a</sup>	
1	NaOEt/EtOH	2.7:1	
2	LDA/THF	1:1	
3	NaHMDS/THF	1.1 : 1	

<sup>a</sup> Ratios were determined by isolated yields.

A simple deprotection scheme was used for the Boc-protected phenyl adduct (Scheme 4).<sup>11</sup> Exposure of *anti*-phenyloxazinone **4a** to excess refluxing ethanolic hydrogen chloride for 2 h and removal of the volatiles provided the ethyl ester HCl salt which was neutralized by refluxing in absolute ethanol containing propylene oxide to afford **8a** in 96% yield. Hydrogenolysis of **8a** under influence of 5% Pd/ C and hydrogen (15 psi) at room temperature gave the phenylglycine ethyl ester. Determination of optical purity of the final phenylglycine derivative is underway.

In conclusion, the *anti*-aryloxazinones were prepared in moderate yields and high diastereoselectivities from the nucleophilic substitution of chiral glycine enolate equivalents with (arene)Mn(CO)<sub>3</sub><sup>+</sup> complexes. Also, *syn*-aryloxazinones were obtained in moderate yields *via* epimerization of *anti*-aryloxazinones. Investigations concerning the conversion of aryloxazinones to arylglycines are underway.

**Acknowledgment.** We are grateful to the Korea Science and Engineering Foundation (92-25-00-08) and Kyung Hee University for financial support of this work.
