# Synthesis and Molecular Structure of Tetrahomodioxa $p$-Phenylcalix[4]arene Tetra Ester Derivative in 1,4-Alternate Conformation 

Kwanhyun No,* Young Ja Park, and Eun Joo Choi<br>Department of Chemistry, Sookmyung Women's University, Seoul 140-742, Korea<br>Received May 20, 1999

#### Abstract

Reaction of tetrahomodioxa $p$-phenylcalix[4]arene with ethyl bromoacetate and potassium carbonate in acetone leads to the title tetra ester derivative, 7,13,21,27-tetra-phenyl-29,30,31,32 -tetrakis(ethoxycarbonyl)meth-oxy-2,3,16,17-tetrahomo-3,17-dioxacalix[4]arene, its structure was determined by NMR spectra as 1,4alternate conformation. The molecular structure has been solved by X-ray diffraction methods. The molecule has a conformation with pseudo center of symmetry. The benzene ring A is up, ring C is down, B and D rings are flat with respect to the plane of the macrocyclic ring.

## Introduction

Calixarenes are synthetic macrocycle available in a variety of ring sizes and are of interest both as complexation hosts for ions and molecules and as frameworks for elaborating more complex structures and have received a great deal of attention in recent years. ${ }^{1-3}$ In contrast to the calix[4]arenes, homooxacalix[4]arenes, containing extra oxygen in the macrocyclic ring, have received little attention mainly because they can only be synthesized in relatively small yield. ${ }^{4-6}$ Dihomooxa $p$ - $t$-butylcalix[4]arene was obtained as a minor product ( $20 \%$ yield) from the direct base-catalyzed condensation reaction of $p$ - $t$-butylphenol and formaldehyde ${ }^{4}$ and then the yield was enhanced up to $25 \% .{ }^{5}$ Tetrahomodioxa $p$ -$t$-butylcalix[4]arene was prepared by Gutsche in $44 \%$ yield from the dehydration of bishydroxymethylated dimer of $p-t$ butylphenol in xylene. ${ }^{6}$ Recently we reported the facile synthesis of bishomomonoxa- and tetrahomodioxa $p$-phenylcalix[4]arene by refluxing the bishydroxymethylated $p$ phenyl phenol in toluene. ${ }^{7}$ There have only been limited studies for the solution conformation and crystal structure of dihomooxa $p$ - $t$-butylcalix[4]arene. ${ }^{8-11}$ Recently Masci and coworkers ${ }^{12}$ reported that the main conformation of tetrahomodioxa $p$ - $t$-butylcalix[4]arene tetra methyl ether is $1,4-$ alternate based on the temperature dependent NMR spectral analysis, however, crystal structure of tetrahomodioxa derivative was not reported yet. In this paper we describe the synthesis and molecular structure determination of tetrahomodioxa $p$-phenylcalix[4] arene tetra ester derivative 4.

## Synthesis

When the mixture of p-phenyl phenol and $35 \%$ formaldehyde was stirred for 4 days at $40^{\circ} \mathrm{C}$ in the presence of potassium hydroxide, the dimer diol 2 was prepared in $55 \%$ yield using the published procedures. ${ }^{13,14}$ Compound 2 ( 3.02 g , 7.32 mmole) was refluxed in toluene $(180 \mathrm{~mL})$ for 20 h to remove water in a Dean-Stark moisture trap to afford the tetrahomodioxacalix[4]arene $\mathbf{3}$ in $79 \%$ yield. ${ }^{7}$ When the homooxacalix[4]arene $\mathbf{3}$ was reacted with excess ethyl bro-
moacetate in acetone in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}, 91 \%$ of compound $\mathbf{4}$ was isolated as crystalline solid. Compound 4 was also prepared with comparable yield from the treatment of compound $\mathbf{3}$ with ethyl bromoacetate in the presence of NaH in the mixture of THF and DMF.

The structure of compound 4 was confirmed by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra and elemental analysis. In the ${ }^{1} \mathrm{H}$ NMR spectrum, the methylenic protons from $\mathrm{ArCH}_{2} \mathrm{Ar}$ and $\mathrm{ArCH}_{2} \mathrm{O}$ bridges appear as two sets of AB quartet. ${ }^{13} \mathrm{C}$ NMR spectrum shows single peak from carbonyl carbon, 8 peaks from aromatic carbons, one peak at 71.24 ppm from $\mathrm{ArCH}_{2} \mathrm{O}$ bridge methylene carbons and one peak at 31.43 ppm from $\mathrm{ArCH}_{2} \mathrm{Ar}$ bridge carbons. These spectral patterns are commensurated with cone or 1,4 -alternate conformation in which two adjacent phenyl rings connected by methylene group are inverted. The position of the methylenic bridge carbons of $\mathrm{ArCH}_{2} \mathrm{Ar}$ at 31.43 ppm indicates that these two adjacent benzene rings are in a syn orientation. ${ }^{15}$ The compound 4 can exist in five well defined conformation instead of the four conformation characteristic of calix[4]arene. They are symmetrical cone, partial cone, 1,2-alternates, 1,3alternate, and 1,4-alternate forms as shown Figure 1. Partial cone, 1,2-alternate and 1,3-alternate conformer, in which

two adjacent benzene rings are in an anti orientation, should show additional methylenic bridge carbon peak at around 37 ppm.

X-ray Structure Analysis. Colorless crystals were recrystallized from a mixture of dichloromethane and methanol. The crystal is unstable in the air and is sealed in the capillary tube. X-ray intensity data were on a Simens SMART ${ }^{16}$ diffractometer/CCD area detector at $-80^{\circ} \mathrm{C}$. Preliminary orientation matrix and cell constants were determined by a collection of 20 seconds and 15 frames, followed by spot integration and least-squares refinement. A hemisphere of data was collected using $0.3^{\circ} \omega$ scans at 20 seconds per frame. The 17330 reflections were integrated and refined using the program of SAINT. ${ }^{17}$ Data analysis and absorption correction were performed using the programs of Simens XPREP. ${ }^{18}$ All of the crystal data are summarized in Table 1.

The structure was solved by direct method and refined using the program SHELXL-97. ${ }^{19}$ The crystal structure has two dichloromethane solvent molecules. The final positional and thermal parameters of non hydrogen atoms are listed in Table 2.

Description of the Structure. The molecule has a conformation with pseudo center of symmetry. The selected molecular geometric parameters are listed in Table 3. These

are mainly as expected for the type of bonds involved. The dihedral angles between the four benzene rings and the mean plane of the 20 atoms-membered macrocyclic ring are 88 , 142,86 and $151^{\circ}$ for ring A to D, respectively. Successive dihedral angles between adjacent benzene rings are 87,87 , 85 and $84^{\circ}$ for $\mathrm{A} / \mathrm{B}$ to D/A, respectively. As shown in Figure 2 , benzene ring $A$ is up, ring $C$ is down, $B$ and $D$ rings are flat with respect to the plane of the macrocyclic ring. Among the four ethyl ester groups, two ester groups bonded ring A and C point outwards, and other two groups attached ring B and D point inwards the macrocyclic ring, and these partly fill the cavity of the molecule and also could major part in flattened benzene units.

Figure 2. ORTEP ${ }^{20}$ drawings showing the conformation and the atomic numbering scheme. From upper right, four units are designated A, B, C and D, clockwise.

## Experimental Section

Unless otherwise noted, materials were obtained from commercial suppliers and used without further purification. Melting points of all compounds were taken in sealed and evacuated capillary tubes on an Mel-temp apparatus and were not corrected. IR spectra were determined on a Nicolet Impact 400 FT-IR spectrometer as KBr pellet. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker AMX 500 instrument (OCRC, Seokang University). Chemical shifts are recorded as $\delta$ values in parts per million relative to TMS ( $\delta$ 0.0 ) as an internal standard. TLC analyses were carried out on silica gel plates (absorbent thickness 250 m ). Flash chromatography was carried out with E. Merck silica gel (230400 mesh ASTM). Elution rate was $2 \mathrm{in} / \mathrm{min}$.

3-(3-Hydroxymethyl-5-phenylsalicyl)-5-phenyl-2-hydroxy-
benzyl alcohol 3 was prepared in 55\% yield following the published procedure. ${ }^{13}$

7,13,21,27-Tetra-phenyl-29,30,31,32-tetrahydroxy-2,3,16, 17-tetrahomo-3,17-dioxacalix[4]arene 3 was prepared in $79 \%$ yield from bishydroxymethylated dimer of $p$-phenylphenol as described elsewhere ${ }^{7}$; mp 236-237 ${ }^{\circ} \mathrm{C}$ (lit ${ }^{7}$ 236$237^{\circ} \mathrm{C}$ ).

7,13,21,27-Tetra-phenyl-29,30,31,32-tetrakis(ethoxycarbon-yl)methoxy-2,3,16,17-tetrahomo-3,17-dioxacalix[4]arene
4. $\mathrm{K}_{2} \mathrm{CO}_{3}$ method: A solution of compound $3(1.00 \mathrm{~g}$, $1.27 \mathrm{mmole})$ in acetone ( 130 mL ) was treated with 700 mg ( 4 mole equivalent of $\mathbf{3}$ ) of anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}$. To this sus-

pension ethyl bromoacetate ( 1.5 mL ) was added, then the reaction mixture was refluxed 24 hr . After removal of acetone by evaporation, the residue was acidified with dilute HCl , then extracted with chloroform. The organic layer was collected, washed with water, dried over anhydrous $\mathrm{MgSO}_{4}$, and evaporated solvent to dryness to yield slightly colored solid which was recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and methanol to give $1.31 \mathrm{~g}(91 \%)$ of the product 4 as crystalline solid. $\mathbf{N a H}$ method: To heated suspension of compound 3 ( 1.00 g , 1.27 mmole) and $\mathrm{NaH}(818 \mathrm{mg}, 60 \%$ oil dispersion, 4 mole equivalent per OH group) in dry THF ( 40 mL ) and dry DMF $(8 \mathrm{~mL})$, a solution of ethyl bromoacetate $(2.0 \mathrm{~mL}, 18$ mmole) in dry THF ( 10 mL ) was added dropwise un Ar and then the reaction mixture was refluxed for overnight. After small amount of ethanol was added to destroy the excess NaH , solvent was removed in vacuo and then the organic material was extracted with methylene chloride. The organic layer was washed with water, dried and evaporated to afford slightly brown colored residue, which was recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and methanol to produce $1.29 \mathrm{~g}(90 \%)$ of the product 4 as crystalline solid. mp 201-202 ${ }^{\circ} \mathrm{C}$; IR (KBr) $1753 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}\right)$ 7.53-7.27 (m, 28, ArH),
