Received June 17, 2003

Key Words : Diastereomer, $\beta$-Aminoalcohol, Nicotinic acid, $\beta_{3}$-Adrenoreceptors

The identification of the third $\beta$-adrenergic receptor subtype ( $\beta_{3} \mathrm{AR}$ ) led to the investigation of $\beta_{3}$-adrenoreceptor agonists as potential agents for the treatment of various metabolic diseases. ${ }^{1}$ Stimulation of $\beta_{3}$-adrenoreceptors on the surface of adipocytes evoked lipolysis and upregulation of the uncoupling protein (UCP1), which led to a net increase in energy utilization. ${ }^{2,3}$ Thus, $\beta_{3}$-adrenoreceptor agonists may prove useful for the treatment of obesity. ${ }^{3}$ In addition, the agonists have also demonstrated a direct improvement on glucose tolerance for treatment of Type II (non-insulin dependent) diabetes. Recently, many pharmaceutical companies have developed $\beta_{3}$-adrenoreceptor agonists, which have shown highly selective binding affinity to $\beta_{3}$ adrenoreceptors (A-D). ${ }^{4}$ The literature reports have shown that the single diastereomer of $\beta_{3}$-adrenoreceptor agonists are often more potent or have less side effects compared to their racemates. ${ }^{5}$ Of the numberous methods for the preparation of chiral aryl substituted $\beta$-aminoalcohols, the most direct method is alkylation of the corresponding chiral amine with arylethylene oxide. ${ }^{6}$ However, direct alkylation in polar, protic solvents generally gave the desired products in low yields with significant amounts of regioisomer and multiply alkylated side products. ${ }^{7}$

Currently, heteroarylethanolamines have also been reported to show significant $\beta_{3}$ agonist activity and minimal cross-reactivity at the $\beta_{1}$ and $\beta_{2}$ receptors. ${ }^{8}$ The $\beta$-aminoalcohol could contain various heterocycles such as oxazole, ${ }^{9}$ pyridine, ${ }^{10}$ and indole. ${ }^{11}$ In an effort to discover new lead compounds for $\beta_{3}$-adrenoreceptor agonist, we were posed with the problem of finding efficient and direct route to
prepare optically pure diastereomeric $\beta$-arylaminoalcohols. We describe herein simple diastereomeric preparation of heterocyclic $\beta$-arylaminoalcohols containing nicotinic acid moiety and their binding affinity to $\beta_{3}$-adrenoreceptors.

## Chemistry

The synthetic procedures for the preparation of diastereomeric $\beta$-aminoalcohols are detailed in Scheme 1. The ( $S$ )-1-azido-3-phenoxypropane-2-ol (2) was obtained by the ring opening reaction of (S)-2-phenoxymethyloxirane (1) with $\mathrm{NaN}_{3}$ in $\mathrm{CH}_{3} \mathrm{CN}$ at $80^{\circ} \mathrm{C}$. The hydrogenation of 1-azido-3-phenoxypropane-2-ol (2) using $\mathrm{Pd} / \mathrm{C}$ provided 1-amino-3-phenoxypropan-2-ol (3) in a quantitative yield. The 5-(3-oxobutyl)-nicotinic acid methyl ester (4) were prepared by palladium-catalyzed coupling reaction of 5-bromonicotinic acid methyl ester with 3-buten-2-ol in a $70-\%$ yield. ${ }^{12}$ The imino compound 5 was obtained by condensation of aminoalcohol 3 and ketone 4 by azeotrophic reflux in benzene. The diasteroisomeric mixture of $\mathbf{6 a}$ was prepared by hydrogenation of imine 5 with $\mathrm{PtO}_{2}$ catalyst under 60 psi hydrogen pressure in solvent. The Boc protected $\mathbf{6 c}$ and $\mathbf{6 d}$ were separated by MPLC with Merck Lobar RP-18 column and $\mathrm{CH}_{3} \mathrm{CN}: \mathrm{H}_{2} \mathrm{O}=1: 1$ as eluant. The compound $\mathbf{6 c}$ and $\mathbf{6 d}$ were obtained by deprotection of Boc group and neutralization. Another set of diastereomeric compounds $\mathbf{6 e}$ and $6 \mathbf{f}$ were also prepared by the same procedure with Scheme 1 except for ( $R$ )-2-phenoxymethyl-oxirane as a chiral substrate (Scheme 2). The stereochemistry of $\mathbf{6 c - 6 f}$ were determined by comparison of literature spectra after ring formation to oxazolodinone with 1,1-carbonyldiimidazole. ${ }^{13}$

## Screening Results

To determine the affinity of these $\beta$-aminoalcohols as $\beta_{3^{-}}$ adrenoreceptor agonists, the receptor binding assay was performed by using cell membrane expressing human $\beta_{3}$ adrenoreceptors (RB-HBETA $)_{3}$. ${ }^{14}$ The data are summarized in Table 1. Unexpectedly, the heterocyclic aminoalcohols containing nicotinic ester have shown similar binding affinities except for $(R, S)$-isomer $\mathbf{6 e}$ which showed a quarter of the affinity compared to the other isomers.

Scheme 2

Table 1. Comparison of the $\beta_{3} \mathrm{AR}$ Affinity of Diastereomeric $\beta$ Aminoalcohols

| Entry | Compound | Configuration | $\mathrm{IC}_{50}(\mu \mathrm{M})$ | $\mathrm{Ki}(\mu \mathrm{M})$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $\mathbf{6 c}$ | $S, S$ | 1.28 | 0.67 |
| 2 | 6d | $S, R$ | 1.15 | 0.61 |
| 3 | 6e | $R, S$ | 4.57 | 2.41 |
| 4 | 6 f | $R, R$ | 1.10 | 0.58 |
| 5 | BRL-35135 | $S, S$ | 3.62 | 1.91 |
| 6 | CL-316243 | $S, S$ | 1.17 | 0.62 |

## Conclusions

The four diastereomers of heterocyclic $\beta$-aminoalcohols were easily prepared by separation of their Boc derivatives as the key step. The introduction of nicotinic acid moiety to $\beta$-aminoalcohols resulted in potent $\beta_{3}$-adrenergic receptor binding affinity. The nicotinic acid moiety could be a potential heterocyclic substrate for the development of $\beta_{3}$ adrenoreceptor agonists.

## Experimental Sections

All chemicals were purchased and used without any further purifications The ${ }^{1} \mathrm{H}$ NMR spectra were obtained on a Varian Gemini 200 MHz or Bruker 300 MHz NMR Spectrometer. The GC-MS spectral were obtained on a Shimazu QP 1000 mass spectrometer. Melting points were deterimined on MU-TEM apparatus and were uncorrected. BRL-35135 and CL-316243 were prepared literature procedures ${ }^{4 \mathrm{~b}}$ and used as reference compounds.
(S)-2-Phenoxymethyloxirane (1) ${ }^{\mathbf{1 5}}$. $\mathrm{NaH}(60 \%$ dispersion
in mineral oil, $0.72 \mathrm{~g}, 18 \mathrm{mmol}$ ) was added to a solution of phenol ( $1.23 \mathrm{~g}, 13 \mathrm{mmol}$ ) in dry DMF ( 10 mL ) and the resulting suspension was stirred for approximately 30 minutes until a clear solution was obtained. A solution of (S)-(+)-glycidyl 3-nitrobenzenesulfonate ( $3.1 \mathrm{~g}, 12 \mathrm{mmol}$ ) in dry DMF ( 7 mL ) was slowly added to phenoxide solution. The mixture was stirred for 6 hours at $20^{\circ} \mathrm{C}$ and poured into saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 50 mL ). The product was extracted with ethyl ether $(3 \times 20 \mathrm{~mL})$. The ethyl ether layer was dried over anhydrous $\mathrm{MgSO}_{4}$ and concentrated. The ( $S$ )-2-phenoxymethyl oxirane was obtained $86 \%$ yields by silica gel column chromatography.
${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 7.30-7.24(\mathrm{~m}, 2 \mathrm{H}), 6.98-$ $6.89(\mathrm{~m}, 3 \mathrm{H}), 4.19$ (dd, $J=10.9,3.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.93(\mathrm{dd}, J=$ $11.3,5.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.33(\mathrm{~m}, 1 \mathrm{H}), 2.87(\mathrm{t}, J=4.9 \mathrm{~Hz}, 1 \mathrm{H})$, 2.73 (dd, $J=4.9,2.6 \mathrm{~Hz}, 1 \mathrm{H})$; Mass m/e (\%) $150\left(\mathrm{M}^{+}, 26\right)$, 119 (10), 107 (35), 94 (100), 77 (50), 65 (40).
(S)-1-Azido-3-phenoxypropane-2-ol (2). The mixture of 0.6 g ( 5 mmol ) of ( $S$ )-2-phenoxymethyloxirane (1), 1.52 g ( 25 mmol ) of $\mathrm{NaN}_{3}$, and $\mathrm{H}_{2} \mathrm{O}$-acetonitrile ( $1: 8,9 \mathrm{~mL}$ ) in 25 mL flask was stirred at $80^{\circ} \mathrm{C}$ for 4 hours. The mixture was poured into 20 mL of cold water. The product was extracted with ethyl ether $(2 \times 20 \mathrm{~mL})$. The organic layer was washed saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 20 mL ) and water. The ethyl ether layer was dried over anhydrous $\mathrm{MgSO}_{4}$ and concentrated. The (S)-1-azido-3-phenoxypropane-2-ol was obtained $97 \%$ yields by silica gel column chromatography.
${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 7.31-7.24(\mathrm{~m}, 2 \mathrm{H}), 7.00-$ $6.88(\mathrm{~m}, 3 \mathrm{H}), 4.16(\mathrm{~m}, 1 \mathrm{H}), 3.93(\mathrm{~d}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.50$ (m, 1H), 2.71 (brs, 1H); Mass m/e (\%) 167 ( $\mathrm{M}^{+}, 3$ ), 149 (4), 123 (23), 94 (100), 77 (25).
(S)-1-Amino-3-phenoxypropan-2-ol (3). The mixture of
(S)-1-azidophenoxypropane-2-ol ( $1.71 \mathrm{~g}, 8.9 \mathrm{mmol}$ ) and $5 \%$ $\mathrm{Pd} / \mathrm{C}(0.2 \mathrm{~g})$ and methanol $(15 \mathrm{~mL})$ in pressure bottle was hydrogenated under 60 psi of hydrogen for 4 h at room temperature. The resulting solution was filtered and concentrated. The was obtained $88 \%$ yields by silica gel column chromatography. mp 104-106 ${ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $300 \mathrm{MHz}) \delta 7.31-7.26(\mathrm{~m}, 2 \mathrm{H}), 6.98-6.90(\mathrm{~m}, 3 \mathrm{H}), 4.01-$ 3.91 (m, 3H), 2.98 (dd, $J=12.8,3.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.86(\mathrm{dd}, J=$ $12.8,6.4 \mathrm{~Hz}, 1 \mathrm{H})$; Mass m/e (\%) 193 (9, M ${ }^{+}$), 119 (34), 107 (21), 94 (100), 77 (65), 65 (26).

5-(3-Oxobutyl)nicotinic acid methyl ester (4). To a $10-$ mL vial containing a magnetic stirring bar was added the following reagents; $\mathrm{Pd}(\mathrm{OAc})_{2}(0.025 \mathrm{mmol})$, KOAc ( 1.0 $\mathrm{mmol}), \mathrm{LiCl}(0.5 \mathrm{mmol}), 3$-buten-2-ol ( 1.0 mmol ), methyl 5bromonicotinate ( 0.5 mmol ) and DMF ( 5 mL ). The vial was sealed with a septum. The mixture was stirred at the $110^{\circ} \mathrm{C}$ for 4 hours. The resulting mixture was diluted with ethyl acetate ( 20 mL ) and washed with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ $(2 \times 20 \mathrm{~mL})$. The ethyl acetate layer was dried over anhydrous $\mathrm{MgSO}_{4}$ and concentrated. The product was obtained $70 \%$ yields by flash column chromatography. mp: $53-54{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \boldsymbol{\delta} 8.96(\mathrm{~d}, 1 \mathrm{H}, J=2.0$ Hz ), $8.66(\mathrm{t}, 1 \mathrm{H}, J=2.4 \mathrm{~Hz}), 8.05(\mathrm{~d}, 1 \mathrm{H}, J=2.0 \mathrm{~Hz}), 3.87$ $(\mathrm{s}, 3 \mathrm{H}), 2.89(\mathrm{t}, 2 \mathrm{H}, J=7.4 \mathrm{~Hz}), 2.76(\mathrm{t}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz})$, 2.09 (s, 3H); Mass m/e (\%) 207 (13, M ${ }^{+}$), 164 (75), 150 (14), 132 (32), 104 (24), 77 (14), 43 (100).
5-[3-(2-Hydroxy-3-phenoxypropylamino)butyl]nicotinic acid methyl ester (6a). A mixture of (S)-1-amino-3-phenoxypropan-2-ol (3) ( 1.0 mmol ), 5-(3-oxobutyl)nicotinic acid methyl ester (4) ( 1.0 mmol ), molecular sieve ( 2 g ) and benzene ( 20 mL ) in 50 mL flask was heated under azeotropic reflux for 20 hours. The resulting solution was filtered and concentrated. The 5-[2-(2-hydroxy-3-phenoxypropylimino)propyl]nicotinic acid methyl esters (5) was obtained $80 \%$ yields as oil. The crude imine (5) and $\mathrm{PtO}_{2}$ (50 $\mathrm{mg})$ were added to methanol ( 15 mL ) in pressure bottle. The mixture was hydrogenated under 70 psi hydrogen for 4 h at room temperature. The resulting solution was filtered and concentrated. The aminoalcohol (6a) was obtained $63 \%$ yields by silica gel column chromatography. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right) \delta 9.02(\mathrm{~d}, 1 \mathrm{H}, J=2.0 \mathrm{~Hz}), 8.60(\mathrm{t}, 1 \mathrm{H}, J$ $=2.0 \mathrm{~Hz}), 8.11(\mathrm{~d}, 1 \mathrm{H}, J=2.4 \mathrm{~Hz}), 7.24(\mathrm{t}, 2 \mathrm{H}, J=8.0 \mathrm{~Hz})$, 6.89-6.87 (m, 3H), 4.15-3.91 (m, 3H), 3.88 (s, 3 H ), 3.63 m , $2 \mathrm{H}), 2.89-2.70(\mathrm{~m}, 5 \mathrm{H}), 1.86-1.67(\mathrm{~m}, 2 \mathrm{H}), 1.19-1.16$ (m, $3 \mathrm{H})$; Mass m/e (\%) 359 ( $100, \mathrm{M}^{+1}$ ), 332 (12), 181 (6), 149 (12), 111(13), 96 (14), 68 (13), 55 (12), 44 (37).

Separation of Boc protected 6c and 6d. 5-[3-(2-Hy-droxy-3-phenoxypropylamino)butyl]nicotinic acid methyl ester ( $\mathbf{6 a}, \mathrm{mmol}$ ) and $(\mathrm{Boc})_{2} \mathrm{O}$ were dissolved in 20 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The reaction mixture was stirred about 12 h at room temperature. The Boc protected 6a was obtained quantitatively by concentration. The Boc protected diastereomers of $\mathbf{6 c}$ and $\mathbf{6 d}$ were separated by MPLC with Merck Lobar RP18 column ( $440 \times 37 \mathrm{~mm}$, \#10626) and $\mathrm{CH}_{3} \mathrm{CN}: \mathrm{H}_{2} \mathrm{O}=$ $1: 1$ eluent (UV-254 nM and $10 \mathrm{~mL} / \mathrm{min}$ ). The diastereoselectivity of $\mathbf{6 c}$ and $\mathbf{6 d}(44: 56)$ was determined by HPLC with Waters Spherisor S 10 ODS2 $(250 \times 4.6 \mathrm{~mm}$,
\#PS832515) and $\mathrm{CH}_{3} \mathrm{CN}: \mathrm{H}_{2} \mathrm{O}=1: 1$ eluent (UV-254 nM and $1.0 \mathrm{~mL} / \mathrm{min}$ ). Measurement of $\boldsymbol{\beta}$-adrenoceptor binding affinity. To determine the binding affinity of $\mathbf{6 c} \mathbf{c} \mathbf{6 f}$ on $\beta_{3}$-adrenorecetor, RB-HBETA3 membrane was incubated with [ ${ }^{125}$ I]iodocyanopindolol ( $1.4 \mathrm{nM}, 2200 \mathrm{Ci} / \mathrm{mmol}$ ) and unlabeled ligand for 10 min at $37^{\circ} \mathrm{C}$. Propranolol $(1 \mathrm{mM})$ was used to define non-specific binding. Incubation mixture was filtered over glass fiber (Wallac 140-521), washed and measured for radioactivity.

Acknowledgments. This work was supported by Ministry of Science and Technology and Bioneer Corporation.
