### Synthesis of Optically Active O-Protected 2,3-Dihydroxy Aldehyde

Suk-Ku Kang,\* Hyun-Sung Cho, Hyeong-Su Shim, and Beon-Kyu Kim

*Department of Chemistry, Sung Kyun Kwan University, Natural Science Campus, Suwon 440-746*

*Received January 24, 1992*

Optically active 2,3-diol units are widely distributed in the biologically active natural products such as macrolides and polyether antibiotics, etc. Recently, synthesis of syn-2,3-diol esters by asymmetric oxidation reactions of olefin esters using osmium tetroxide with a chiral ligand has been developed.<sup>1</sup> Also, synthesis of anti-2,3-diol esters by asymmetric aldol reaction between aldehydes and silyl enol ethers derived from  $\alpha$ -benzyloxy thioesters with a chiral ligand was reported.<sup>2</sup> There still remains a need for the synthesis of optically active syn- and anti-diols on practical point of view. In connection with our current programs on the asymmetric synthesis of optically active natural products from D-glucose

(a) Tf<sub>2</sub>O, Pyr, CH<sub>2</sub>Cl<sub>2</sub>, -10°C (b) DBU, ether, rt (c) Sia<sub>2</sub>BH, THF, 0°C → rt (d) NaH, BnCl, THF, rt (e) 2 N HCl, DME, rt (f) NaIO<sub>4</sub>, MeOH, rt (g) DMSO, (COCl)<sub>2</sub>, Et<sub>3</sub>N, CH<sub>2</sub>Cl<sub>2</sub>, -60°C → rt (h) NaBH<sub>4</sub>, MeOH, -78°C.

**Scheme 1**

or D-xylose, we needed the appropriately protected syn- and anti-2,3-dihydroxy aldehydes 1. Here we report a stereocontrolled synthesis of optically active four stereoisomers of 2,3-dihydroxy aldehydes by chemical modification of the  $\alpha$ -D-glucopyranose or  $\alpha$ -D-xylofuranose, which in turn were prepared from D-glucose or D-xylose.

Hex-3-enofuranose 3a-c were prepared<sup>3</sup> by the elimination reaction of the triflates derived from C-3 hydroxyfuranoses 2a-c.<sup>4,5</sup> Hydroboration of 3b with disiamylborane followed by oxidation with H<sub>2</sub>O<sub>2</sub>/NaOH afforded 3-hydroxy- $\beta$ -L-threo-hexofuranose 4b<sup>6</sup> (TLC: SiO<sub>2</sub>, EtOAc/Hexanes=1:1, R<sub>f</sub>=0.48), [ $\alpha$ ]<sub>D</sub><sup>25</sup> -25.5° (c 0.44, CHCl<sub>3</sub>) exclusively as the only isolated product<sup>7</sup> in 65% yield after column chromatographic separation. Orientation of the ethyl- and hydroxy- substituents of 4b and excellent stereoselectivity (>99%)<sup>7</sup> were confirmed by the comparison of the <sup>1</sup>H- and <sup>13</sup>C-NMR spectra and capillary GLC data of 4b and 8b (Scheme 1).<sup>8</sup> Surprisingly, by capillary GLC analysis, only one isomer was detected before and after column chromatographic separation. Even if hydroboration of 3b with BH<sub>3</sub>·SM<sub>2</sub> followed by oxidation with H<sub>2</sub>O<sub>2</sub>/NaOH also gave 4b as a major product by checking GLC, hydroboration of 3b with disiamylborane followed by oxidation afforded 4b as the only isolated product without any impurities. Removal of the hemiacetal group in 5b with 2 N HCl provided the hemiacetal, which was subjected to oxidative cleavage with sodium periodate to afford the (2S, 3S)-2-benzyloxy-3-formyloxy-1-pentanal 1b<sup>9</sup> (TLC: SiO<sub>2</sub>, EtOAc/Hexanes=1:1, R<sub>f</sub>=0.62), [ $\alpha$ ]<sub>D</sub><sup>25</sup> -61.8° (c 0.60, CHCl<sub>3</sub>) (Scheme 1). The reaction sequence was also applied to prepare (2S, 3S)-1a and (2S, 3S)-1c,

which is shown in Scheme 1.<sup>8</sup> The C-3  $\beta$ -hydroxy-group in **4b** was converted to  $\alpha$ -hydroxy-group. Swern oxidation of **4b** followed by reduction with NaBH<sub>4</sub> in MeOH at -78°C afforded **6b**<sup>6</sup> as the only isolated product by checking GLC data of **6b** and **4b**. The compound **6b** was converted to the (2*R*, 3*S*)-2-benzyloxy-3-formyloxy-1-pentanal **1b**<sup>9</sup> (TLC: SiO<sub>2</sub>, EtOAc/Hexanes=1:1, *R<sub>f</sub>*=0.62), [ $\alpha$ ]<sub>D</sub><sup>25</sup> +46.3° (*c* 1.0, CHCl<sub>3</sub>) (Scheme 1). The reaction sequence was also applied to prepare (2*R*, 3*S*)-**1a** and (2*R*, 3*S*)-**1c**, which is shown in Scheme 1.<sup>8</sup>

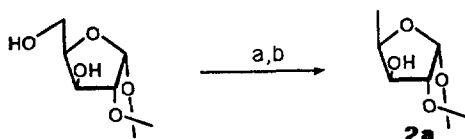

Alternatively, (2*S*, 3*R*)- and (2*R*, 3*R*)-2-benzyloxy-3-formyloxy-1-alkanals were easily prepared from **2**. Benzylation of **2b**<sup>6</sup> gave the benzyloxy compounds **7b**, which was converted to the (2*S*, 3*R*)-2-benzyloxy-3-formyloxy-1-pentanal **1b**<sup>9</sup> (TLC: SiO<sub>2</sub>, EtOAc/Hexanes=1:1, *R<sub>f</sub>*=0.62), [ $\alpha$ ]<sub>D</sub><sup>25</sup> -47.0° (*c* 0.2, CHCl<sub>3</sub>) (Scheme 1). The reaction sequence was also applied to prepare (2*S*, 3*R*)-**1a** and (2*S*, 3*R*)-**1c**, which is shown in Scheme 1.<sup>8</sup> On the other hands, Swern oxidation of **2b** followed by reduction with NaBH<sub>4</sub> in MeOH at -78°C afforded **8b**.<sup>6</sup> The compound **8b** was converted to the (2*R*, 3*R*)-2-benzyloxy-3-formyloxy-1-pentanal **1b**<sup>9</sup> (TLC: SiO<sub>2</sub>, EtOAc/Hexanes=1:1, *R<sub>f</sub>*=0.62), [ $\alpha$ ]<sub>D</sub><sup>25</sup> +51.3° (*c* 1.97, CHCl<sub>3</sub>) (Scheme 1). The reaction sequence was also applied to prepare (2*R*, 3*R*)-**1a** and (2*R*, 3*R*)-**1c**, which is shown in Scheme 1.<sup>8</sup>

We have used optically active *O*-protected 2,3-dihydroxy aldehydes prepared by this methodology in the enantioselective syntheses of L-factor and muricatacin.<sup>10</sup>

## Atomic Emission Detector for Gas Chromatography using Cylindrical Microwave Cavity

Young-Joo Park, Hee-Soo Yoo\*, and Nam-Soo Lee

Department of Chemistry, Chungbuk National University,  
Cheongju 360-763

Received January 28, 1992

The microwave induced plasma (MIP) has been increasingly applied as an excitation source for the emission detector of gas chromatography (GC).<sup>1-5</sup> The MIP detector is known to have high sensitivity and element selectivity, be-
